What is silicon nitride (Si₃N₄)? Silicon nitride is an inorganic and non-metallic material made of silicon and ni-trogen, two elements that are essential for life.¹²⁴ First synthesized in 1857, silicon nitride was commercialized in the 1950s. Research funded by the US, EU, and

Silicon Nitride is the winner when it comes to its ability to take

the heat and abrasion dished out by extreme saltwater conditions and long screaming runs against tight drags. Use originally as a ball bearing material in jet engines, SiN can handle just about anything including wire line. SiN rings are slightly heavier and larger in diameter than other rings to maintain the rugged specifications that make them the perfect choice for heavy duty boat or offshore rods.

Silicon nitride (Si₃N₄) offers one of the greatest cross-sections of material properties across both oxide and non-oxide fine ceramic groups. It is a specialist solution for extreme working environments, meeting the requirements for some of the harshest in-

dustrial conditions on earth.

Today, the tip-cantilever assembly typically is microfabricated from silicon or silicon nitride (Si₃N₄). The radius of curvature of these tips is about 5–10 nm. For high resolution, imaging tips with a very high aspect ratio are necessary. There are several techniques to microfabricate sharper tips.

The ceramic material known as silicon nitride is an all-round

talent in the technical ceramics arena. With its great strength and fracture toughness, very good thermal shock resistance and excellent wear and impact resistance, silicon nitride is ideal for a wide range of applications. But there's more to this material than that. Its low-density and great strength also enable optimal implementation of lightweight structures.

Silicon nitride (Si_3N_4) is a light, hard, and strong engineering ceramic that has been developed mainly as a structural material for high-temperature applications. Although creep resistance and superplasticity are incompatible functions, superplastic forming of silicon nitride can be applied to make wear-resistant components that are used at intermediate temperatures.
